Received Date: 19 December 2020, Accepted Date: 11 April 2021, Published Date: 30 May 2021

Doi: <https://doi.org/10.26842/inhmp.7.2021.1.39.0023>

Abstract

The revision provides an updating checklist of Collembola that showed 48 species and 3 subspecies belonging to 28 genera under 10 families and 4 orders from Iraq are presented.

This study is a contribution to the data concerning the biodiversity of springtails group; also the synonyms and valid names were given in the current investigations; however, the information about this group is still poorly known, and it is expected that there will be more species that are still undiscovered.

Keywords: Collembola, Checklist, Iraq, Museum, Springtail.

Introduction

Collembola are amongst the most prevalent and abundant soil arthropods (Petersen and Luxton, 1982; Hopkin, 1997). It commonly known as "springtails"; they small and permanently wingless arthropods; in the year 1870, Sir John Lubbock gave the name Collembola to this guild of insects and belong to the subclass Apterygota; they small to minute forms with a range length from 0.25 mm to 6 mm. Springtails are minor pests in agriculture, but its importance as a biological agent in the soil; many species are now

Checklist of springtails

known as bio-indicator of soil pollution as well as its fertility. The species of collembola have a very wide distribution around the entire world (Hazra and Mandal, 2007; Mandal and Hazra, 2009).

Mouthparts entognathous, principally adapted for biting; antennae usually 4-segmented; compound eyes absent. A tracheal system is usually absent and there are no Malpighian tubules. Springtails have three thoracical segments and with six or fewer abdominal segments, including a telson consisting of a dorsal and two ventral valves surrounding the anus; there are typically four antennal segments, lack malpighian tubules and most have paired labial nephridia that empty into the ventral groove at the base of the labium; with unique feature is the ventral tube or collophore (paired projection from the first abdominal segment), metamorphosis slight (Richards and Davies, 1977; Christiansen *et al.*, 2009).

Collembola composed of two suborders; Arthropleona (consist of five families including, Entomobryidae, Hypogastruridae, Isotomidae, Onychiuridae and Poduridae) and Symphypleona (with two families: Neelidae and Sminthuridae) (Hnazra and Mandal, 2007). Recently, Bellinger *et al.* (1996–2021), classified the Collembola into four orders: Poduromorpha Börner, 1913; Entomobryomorpha Börner, 1913; Symphypleona Börner, 1901 and Neelipleona Massoud, 1971.

Globally, there are 9, 000 species within this guild have been described (Bellinger *et al.*, 1996–2021). In adjacent regions of Iraq, Shayanmehr *et al.* (2013) listed 120 species for Iran in them updating checklist; followed by Shayanmehr *et al.* (2020), they update the database of Collembola and reported 232 species belonging to 95 genera, then Yahyapour *et al.* (2021) added 3 species for the first time. Sevgili and Özata (2014), they listed in their study 53 species and 39genera belonging to 13 families in Turkey, after that Özata *et al.* (2017) renewed the list, and they mentioned the presence of 83 species

M. S. Abdul-Rassoul

in Turkey; whereas in other regions, the studies that dealing with a checklist of Collembola remain poor, unclear and not updated.

In Iraq, there are a few and scattered studies on this group, such as: Brown (1926) listed 15 species and 3 subspecies during his investigations for this group of Mesopotamia; Rusek (1981) recorded 17 species, after that Al-Gailani (1990) studied this group in the middle of Iraq. Jordana and Baquero (2010) described *Entomobrya iraqensis* as a new species belong to Entomobryidae from Mosul city; Baquero *et al.* (2014) listed the species *Entomobrya obscurella* Brown, 1926 from Iraq.

Revised synonyms and corrected the scientific names according to the references that including: Jordana *et al.* (1997), Janssens (2021), and updating information on the website of the Global Biodiversity Information Facility (GBIF Secretariat, 2021); on the other hand, the systematics of the higher taxa that is given here is in line with some of the more recent opinions, such as: Bretfeld (1999), D'Haese (2002), Deharveng (2004) and Bellinger *et al.* (1996-2021). Collembola are not considered as being class Insecta, but as a taxonomic group with the same rank to it.

The present study gives an update list of the Collembola that recorded in Iraq, and treating the scientific names according to recent catalogs and publications.

Discussion

In Iraq, previously, some species were listed under the synonym names which included: *Ceratophysella armata* (H. Nicolet, 1842) recorded as *Achorutes buxtoni* J. M. Brown, 1926 by Brown (1926); on the other hand, he recorded *Seira pallida* Börner, 1907 as sp. nov., but in GBIF secretariat (2021) referred to Börner, 1907 according to priority. *Mesogastrura ojcoviensis* (Stach, 1919) was reported by Hussain (1974) under the name of *Hypogastrura inermis* R. Dallai & E. Malatesta, 1983; at last, he listed *Acherontiella bougisi* P. Cassagnau & C. Delamare Deboutteville, 1955 under the synonym *Willemia bougisi* Cassagnau and Delamare-Deboutteville, 1960.

Acknowledgment

We are a family of the deceased Prof. Dr. M. S. Abdul-Rassoul (May God have mercy on him), that gives our thanks and gratitude to

M. S. Abdul-Rassoul

Prof. Dr. Razzaq Shalan Augul and Assistant Prof. Dr. Hanaa Hani Al-Saffar, Iraq Natural History Research Center and Museum, University of Baghdad for their review and checking of scientific names before submitting this paper to the editorial board of this publication. Also, we grateful the administration of the Natural History Research Center and Museum for their support and encouragement to us in disseminating this scientific outcome.

قائمة مرجعية لصنف قافزات الذنب (Class, Collembola) من العراق

محمد صالح عبد الرسول
مركز بحوث و متحف التاريخ الطبيعي(استاذ متفرغ)، جامعة بغداد، بغداد،
العراق

تأريخ الاستلام: 19/12/2020 ، تأريخ القبول: 11/04/2021 ، تأريخ النشر: 30/05/2021

الخلاصة

يوفّر هذا العمل قائمة المراجعة المحدثة للمفصليات التابعة لصنف قافزات الذنب Collembola في العراق؛ التي أظهرت 48 نوعاً و 3 نويعات تتنمي إلى 28 جنساً ضمن 10 عائلات و 4 رتب.

هذه الدراسة هي مساهمة في البيانات المتعلقة بالتنوع البيولوجي لمجموعة ذات الذنب القافز. كما تم إعطاء المرادفات والأسماء الصحيحة في التحقيقات الحالية؛ ومع ذلك ، لا تزال المعلومات حول هذه المجموعة غير معروفة بشكل جيد ، ومن المتوقع أن يكون هناك المزيد من الأنواع التي لا تزال غير مكتشفة.
